Gopal conducted an experiment to find out the strength of four magnets, A, B, C and D. For each magnet, he moved the paper clip away from the magnet until it reached Distance Y. Distance Y was the maximum distance just before the paper clip was attracted by the magnet as shown in the diagram below.

Then he recorded the results in the graph shown below.

![Graph showing Distance Y (cm) for Magnets A, B, C, and D.]

Based on the graph above, arrange the strength of the magnet from the weakest to the strongest.

(1) B, A, C, D
(2) C, D, B, A
(3) A, C, B, D
(4) D, B, C, A
The diagram below shows a circuit connecting 4 bells, A, B, C and D.

Which of the bells will produce sound energy?

(1) A and B only  
(2) C and D only  
(3) A, B and D only  
(4) B, C and D only

Nadiah wanted to find out how different factors affect germination. She listed the variables which she would use below.

J: Light  
K: Water  
L: Number of green beans planted  
M: Temperature of the environment

She made a list of the experiments which she would like to conduct in the table below. Which one of the following experiments will enable her to conduct the experiment correctly?

<table>
<thead>
<tr>
<th>Aim of experiment</th>

<td>15</td>
</tr>
</tbody>
</table>

(a) Based on the information above, what is the relationship between the temperature of the water in the metal tray and the rate of condensation taking place? [1m]

__________________________________________________________________________
__________________________________________________________________________

(b) State the purpose of pouring water at 10°C and 20°C into the metal trays. [1m]

__________________________________________________________________________
__________________________________________________________________________
(c) After one hour, Mei Hui removed both metal trays and placed them on a table as shown below.

Mei Hui then measured the volume of the remaining water in Tray A and Tray B. What is the aim of her experiment? [1m]

________________________________________________________________________

________________________________________________________________________

(d) State one other factor of evaporation not demonstrated in the experiment above. [1m]

________________________________________________________________________
A, B, C, D and E are five living things in a community. The following is information about these living things.

A eats E and C.
B is eaten by C and E.
D is a food producer.
D is eaten by B and C.

(a) Using the information provided above, complete the food web below. Write the correct letter A, B, C, D and E in each circle. [2m]

(b) What will happen to E if there was a sudden increase in the population of C? [1m]

________________________________________________________________________
________________________________________________________________________
Aidil carried out an experiment as shown below. He placed different aquatic plants in the funnels in set-ups A and B to find out which aquatic plant has a faster rate of photosynthesis.

(a) Besides counting the number of air bubbles produced by the plants, what other data could he collect to meet the aim of her experiment? [1m]

(b) Aidil’s father suggested that he should include another set-up without any plants in it. What would be the reason for including this set-up? [1m]
Ming Wei conducted an experiment as shown in the diagram below.

He pulled the elastic band backwards, together with a toy car to an extension of 2 cm. When he released the elastic band, the toy car moved a short distance forward. He recorded the distance moved by the toy car and he repeated the experiment by increasing the extension of the elastic band.

<table>
<thead>
<tr>
<th>Extension of elastic band (cm)</th>

</tbody>
</table>

(a) What can you conclude about the relationship between the extension of the elastic band and the distance moved by the toy car? [1m]

(b) Without changing the toy car, suggest another way to increase the distance moved by the toy car. [1m]
The diagram below is a cross-section of part of a stem showing the transportation tubes of a plant.

(a) (i) ________________ is the part of the stem that transports water from the roots to the leaves. [1m]

(ii) ________________ is the part of the stem that transports food to all parts of the plant. [1m]

(b) What will happen to the plant if the tubes mentioned in (a) above are destroyed? Why? [2m]

__________________________________________________________________________

__________________________________________________________________________
Helen and Alwyn wanted to find out which mixture makes the strongest concrete beam. They made beams of the same size using different amounts of sand and cement. One week later, they tested the beams to see how strong they were. They set up an experiment as shown in the diagram below.

From each beam, they hung weights, gradually increasing the weights until the beam broke. The table below shows their results.

<table>
<thead>
<tr>
<th>Amount of cement (cups)</th>
<th>Amount of sand (cups)</th>
<th>Mass at which beams broke (kg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>1</td>
<td>7.0</td>
</tr>
<tr>
<td>4</td>
<td>2</td>
<td>5.5</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>4.0</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
<td>3.5</td>
</tr>
</tbody>
</table>

(a) What effect does using more cement in the mixture have on the strength of the beam? [1m]

____________________________________________________________________________________

____________________________________________________________________________________

(b) What range of mass (in kg) do you think will be needed to break the beam if 3 parts cement and 2 parts sand are used? [1m]

Between ________ kg and ________ kg.
Alwyn dropped a weight of 6 kg from a height of 60 cm onto a container of sand. The weight created a circular dent in the container of sand as shown in the diagram below.

(c) Draw the circular dent if he dropped a weight of 4.5 kg onto the same container of sand. [1m]
The graph below shows how the length of Diana’s shadow changes over a period of time as she walks in a straight line near a street lamp at night.

Length of shadow (m)

(a) Is Diana walking towards or away from the lamp during the Period Y shown in the graph? Give a reason for your answer. [2m]

________________________________________________________________________

________________________________________________________________________

(b) From the graph, Kelvin concluded that Diana was walking at a slower speed during Period X compared to Period Y. Explain how Kelvin came to this conclusion. [1m]

________________________________________________________________________

________________________________________________________________________
Joanne wanted to find out if Object R is a magnet. She placed one end of Object R near the North-seeking pole of the horseshoe magnet.

She noticed that Object R was attracted to the North-seeking pole of the magnet and concluded that Object R is a magnet.

(a) Do you agree with Joanne? Yes or no? Why? [2m]

(b) Joanne observed that the horseshoe magnet was able to attract 10 nails. She then placed the magnet in a beaker of boiling water for 20 minutes. Next, she brought the horseshoe magnet near a box of nails. She observed that the magnet was able to attract only 4 nails after it was heated. What was Joanne trying to find out? [1m]
Tips
Here are some useful tips to help you tackle open-ended questions.

- Read and understand the question.
- Look for the key words and underline them.
- Think of the topic related to the question.
- Think of the concepts that help to answer the question.
- Apply the appropriate concepts to answer the question.
- Note the marks awarded to each question in order to estimate the amount of information required in the answer.

Let us try applying the tips to this question:

Concept:
It is important to know how fruits are developed. Basically, the process of pollination and fertilization must take place and it is important to know the function of the stigma and presence of ovary in a flower to fulfill these two functions before the fruit is developed. So in your answer, do emphasise on these two processes.

Analysing the pictures:
Flower A has its stigma and ovary intact. Though the anthers are not present, pollination can still take place if the pollen grains are made to land on the stigma via other means. Pollination and fertilization hence can take place and A will develop into a fruit.

Flower C does not have petals but the stigma and ovary are intact. Petals help to attract pollinators but the absence of petals does not hinder pollination and fertilization.

Qn The diagrams below show four flowers from the same plant. Some parts of the flowers have been removed.

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
</tr>
</thead>
</table>

(c) Which of the above flower(s) cannot develop into a fruit? [1m]

(d) Explain your answer in (a). [2m]
Flower D has an intact anther, as well as a stigma and an ovary. Pollination and fertilization leading to fruit formation can take place. Having done this thorough analysis, Flower B is the answer.
Qn The picture below shows three aquatic plants, A, B and C, in a pond.

(c) Name an adaptation that enables aquatic Plant C to float on water. [1m]

__________________________________________________________________________________

__________________________________________________________________________________

(d) If the water in the pond becomes muddy, which plant will die first? Explain your answer. [3m]

__________________________________________________________________________________

__________________________________________________________________________________

__________________________________________________________________________________

Concept:
You would need to know the adaptation of floating plants and the significance of being able to float.

Recall:
Part (a) requires you to do a basic recall of ‘swollen leaf stalks’ that contain air (sacs) to enable the plant to float.

Application of knowledge of topics
Part (b) requires you to make a connection with the process of photosynthesis that requires light and the advantage that floating plants have over submerged plants. You would also need to infer that muddy waters prevent sunlight from reaching the deeper part of the pond and this will affect the submerged plant significantly.
Qn Mei Hui poured water at 80°C into two identical beakers, A and B, as shown below. She then covered Beakers A and B with a metal tray. She poured 100ml of water at 10°C into the metal tray on Beaker A and 100ml of water at 20°C into the metal tray on Beaker B. After 10 minutes, she counted the number of water droplets formed on the underside of both metal trays and recorded her findings in the table below.

<table>
<thead>
<tr>
<th>Temperature of the water in the metal tray</th>
<th>Number of water droplets formed on the underside of the metal tray</th>
</tr>
</thead>
<tbody>
<tr>
<td>10°C</td>
<td>25</td>
</tr>
<tr>
<td>20°C</td>
<td>15</td>
</tr>
</tbody>
</table>

(a) Based on the information above, what is the relationship between the temperature of the water in the metal tray and the rate of condensation taking place? [1m]

(b) State the purpose of pouring water at 10°C and 20°C into the metal trays. [1m]
(c) After one hour, Mei Hui removed both metal trays and placed them on a table as shown below.

Mei Hui then measured the volume of the remaining water in Tray A and Tray B. What is the aim of her experiment? [1m]

(d) State one other factor of evaporation not demonstrated in the experiment above. [1m]

Concept:
This question focusses on the topic Water and Changes of States. More specifically, you would need to know the processes of condensation and evaporation very well. Part (a) requires you to know the meaning of ‘relationship’ very well. Having understood that, you would need to analyse the data presented on the table. Is there a direct relationship between the temperature of water and the number of water droplets formed ie at a higher temperature, were there more droplets formed or otherwise? Knowing this will help you determine the relationship between the two variables.

Part (b) requires you to know the condition for condensation. Condensation happens when there is a cooler surface for water vapor to change state. So looking at the diagram of the set-up closely, focusing on the difference in the temperature of the water, you should be able to tell that the water with a lower temperature provides that cooler surface for condensation to happen.

For Part (c), look at the diagram of the experimental set-up closely. Identify the changed variable in the set-up and link it to what you want to ‘measure’ in the experiment. What process affects the change in the volume of water in this experiment? Once you have correctly identified the process to be ‘evaporation’ look carefully at the set-up again. The diagram of the fan (think ‘wind’) will give you a big clue. Next you would need to recall the factors that affect the rate of evaporation. These hints should help you answer (c). But be careful…it is not enough to write just ‘wind’ as an answer. Are you referring to ‘presence of wind’ or ‘strength of wind’? It is important to be specific when you answer.
Part (d) is quite straightforward once you have done your analysis and identified all the factors that affect the rate of evaporation.
